

## ***Structural Spacer Glazing Tape SST Now from stock!***

### ***We are pleased to announce that National Seal Systems Ltd***

Can now supply Structural Spacer tape from stock .

The most popular thicknesses of 3 ,6, 8 and 9.5mm. can be cut to any width at short notice in house.

SST is a specialised load bearing PVC foam tape, designed to act as a spacing element between the IG (insulated glass) unit and frame during the assembly of structural glazing fabrications.

#### **Main Application**

Recommended for use as a spacing element in structurally glazed fabrications. SST forms an effective short-term bond between the frame and the IG unit during assembly and creates a gap of the correct dimensions for the structural silicone, which is used as the primary bond.

#### **Application Instructions**

##### Surface preparation

Surfaces should be clean, dry and free from all contamination. The surfaces should be cleaned using a Appropriate Arbo cleaner. Primers may be required on some substrates

#### **Application**

Unwind the tape and apply the 'open' face directly to the frame. Cut to the required length forming tight butt joints at the corners. Press the tape firmly onto the surface by hand or by using a seam roller Remove the protective liner immediately before glazing. Carefully position the IG unit onto the tape and apply pressure to consolidate the bond. The structural silicone can now be applied.
